Road Surface Management System (RSMS)

The field evaluation of the Town of Windham's paved roads was completed on December 1, 2016 by Everett Hammond, PE (Hammond Engineering) with the assistance of Josh Dryden (Windham Highway Foreman). Road Surface Management System (RSMS) is a management system for roads provided by the Maine Local Roads Center. RSMS 2010 version provides a condition survey of all roads based on data from roughness and road condition and ranks the roads in order of traffic volume and importance. This data is utilized to provide a recommended Annual Paving Budget and a long term Capital Plan for the Town's paved roads. If applied correctly, this plan can be used to apply timely, cost effective road improvements for paved roads. This RSMS evaluation is a snapshot in time of the condition of Windham's roads which may need to be adjusted over time to reflect unexpected pavement changes.

According to the University of New Hampshire technology transfer Center the goal of a Road Surface Management Plan should be the following:

- **Maximize Return on Investment (ROI) for each dollar spent on road maintenance**
- **Maintain highest possible town-wide road quality**
- **Create a transparent, systematic and non-biased methodology for road repairs**
- **Generate long term budgetary estimates and work plans**

Developing the Road Surface Management System involved the following steps:

1 Data Collection:

The following data was collected and utilized in the RSMS Program:

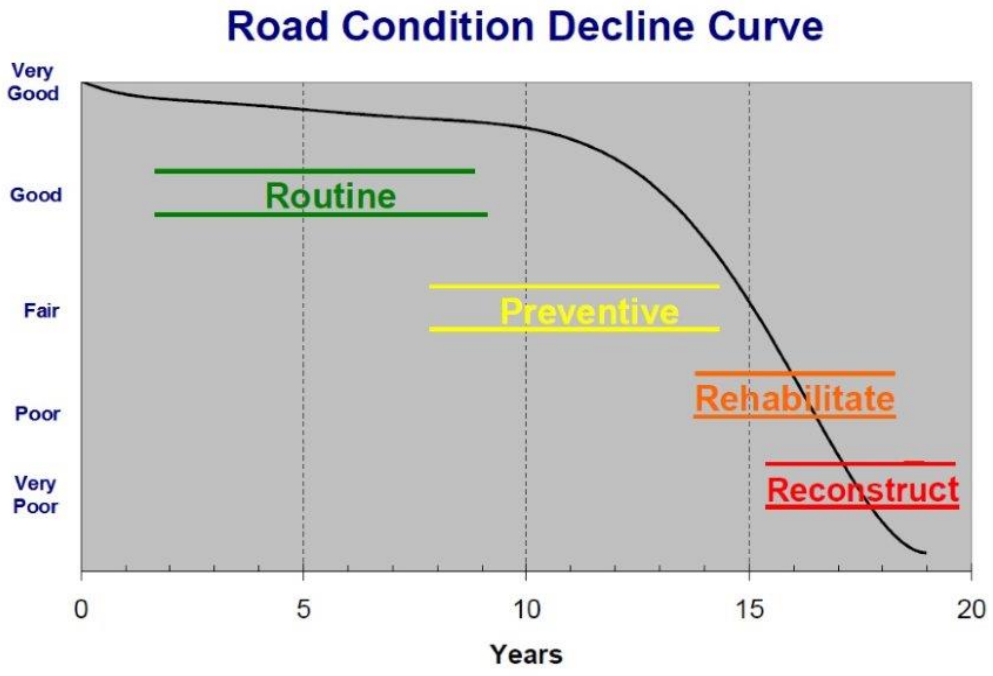
- **Roughness:** Roughness is used as an importance in calculating the condition assessments. This is based on the severity and extent for each road.
- **Road Condition:** Road condition has many factors that determine its level of importance. This consists of alligator cracks, longitudinal/transverse cracks, edge cracks, rutting and drainage. This is also based on the severity and extent for each road.
- **Traffic Volume:** The program uses traffic volume when establishing the priorities of repairs within each repair strategy. The traffic volumes were estimated by Everett Hammond and based on the Classification of the roads.
- **Importance:** The RSMS 2010 version utilizes road importance as an additional factor when establishing the priorities of repairs within each repair strategy. This is one area where local officials can offer their input.

2 Inventory Results – Paved Roads:

A list of the results from the RSMS of this data is attached. The basis of the rating system on the older version of RSMS was based on Pavement Condition Index (PCI). That program would use the roughness and the condition of the road to compute the PCI Index. The PCI is based on a scale of 0-100 with 0 being the worst and 100 being the best. This 2010 version of RSMS does not utilize the PCI index as it was found that Towns were concentrating their efforts on the worst roads with less emphasis on the roads that should be preserved. The new version of RSMS uses the following categories:

- No Maintenance (very good)
- Routine (good)
- Preventative (fair)
- Rehabilitate (poor)
- Reconstruct (very poor)

The average condition for Windham's paved roads is between Preventative (Fair) and Rehabilitate (poor).



The above chart is from the Maine RSMS Program. The TIME element on the above chart will vary greatly from road to road depending on how well it was initially constructed.

3 Repair Strategies – Paved Roads:

There are many road repair strategies used on Town Highways. In general, the better the condition of the road results in a lower cost repair strategy. The following repair strategies have been used in the attached Capital Plan.

- **No Maintenance:** No work is required (generally newly surfaced roads)
- **Routine Maintenance:** This is the most cost effective use of funds and includes ditching, cleaning culverts and patching.
- **Preventative:** This strategy includes crack filling, chip seals, shimming, overlays or a combination of these depending on the nature of the road surface.
- **Rehabilitate:** This strategy generally includes milling/shimming/overlaying or reclamation of the existing pavement followed by a minimum of 4" of new

pavement. It is important to review the existing base material prior to any type of rehabilitation, as an undesirable base will not adequately support a reclaim project even if stabilized with cement, asphalt or chloride. In some cases the road may require preservation of the road such as a shim or shim/chip seal in order to buy time for a complete rehabilitation.

- **Reconstruct:** This includes the complete excavation of the existing pavement and inadequate base material, installation of new drain pipes and underdrains where appropriate, installation of fabric as needed, 1.5' to 2' of new gravel base (depending on the road) and new pavement (2.5" minimum base, 1.5" minimum top). Some of the heavier travelled roads may require up to 2.5' of base and 5" to 6" of pavement.
- **Defer:** It is important to recognize when a road has gone beyond the point of rehabilitation than it should be classified as a candidate for Reconstruction. There are cases where capital funds can be saved on this type of road by simply deferring maintenance until the road has reached the end of its useful life. Deferring can free up Capital funding for use on other roads. If selected appropriately deferred roads can save money by preventing overlays and reclamations on roads subject to failure. Deferring a road needing Capital Improvements may require a shim or shim and chip seal to hold the road in place long enough to obtain funding for Capital Improvements, however once a shim is completed it is important to get another 10 years +/- prior to prior to reconstructing.

4 Repair Concepts:

According to the Chart from the Maine Local Roads Center on the previous page, it is more cost effective to take care of the good roads than to address the poor or failed roads. For this reason it is imperative to preserve the GOOD roads (Preventative Category) with chip seals and or pavement overlays prior to the significant drop in condition.

According to the University of New Hampshire technology transfer the guiding principals of a Road Surface Management Plan should be as follows:

- **Use money as efficiently as possible**
- **Make repair decisions based on road surveys**
- **Avoid "worst first" methodology"**
- **Avoid arbitrary repair selection**
- **Prepare multi – year road maintenance plan**

The strategy used in this RSMS preserves the good roads first prior to starting on Capital Improvements. The essential part of this plan is to avoid "WORST FIRST".

5 Pavement Management, Rehabilitation and Reconstruction techniques and cost estimates:

There are many techniques to choose from with a wide range of cost for each technique. The following list contains costs in 2015 dollars based on the RSMS road width program of 20':

- Defer to Reconstruction (defer): Cost = cost of patching/year
- Reclaim pavement, revert to gravel: $20,000/mile
- Chip seal (cs) with 3/8" washed stone: $34,000/mile

- Chip Seal (cs 10%) 3/8" washed stone with 10% rubber added: $45,000/mile
- Chip Seal (cs 20%) 3/8" washed stone with 20% rubber added: $60,000/mile
- Shim (s) based on an average thickness of ½ ": $30,000/mile
- Shimlay (sl) used as a 1" avg. shim without an overlay: $60,000/mile
- Overlay (o) based on a thickness of 1": $60,000/mile
- Overlay (o) based on a thickness of 1.25": $75,000/mile
- Overlay (o) based on a thickness of 1.5": $90,000/mile
- Mill (m) based on 2" depth: $30,000/mile
- Shim/chip seal (s/cs): $64,000/mile
- Shim/chip seal (s/cs 10% rubber): $75,000/mile
- Shim/chip seal (s/cs 20% rubber): $90,000/mile
- Shim/overlay (s/o) ½" shim, 1" overlay: $90,000/mile
- Mill/shim/overlay (m/s/o) 2" mill, ½" shim, 1.5" overlay: $120,000/mile (plus adjust. Structures)
- Reclamation (reclaim): $300,000/mile (minor ditching, reclaim, grade, compact, traffic control, 4" mix)
- Reclaim, stabilize base (reclaim, stabilize): $350,000/mile
- Reclaim, add 6" gravel (reclaim, 6" gravel): $400,000/mile
- Reclaim (reclaim, 6" gravel, stabilize): add 6" gravel, stabilize: $450,000/mile
- Reclamation (reclaim +): $400,000/mile (includes ditching, reclaim, tree removal, traffic control, new culverts, 4" mix)
- Reclaim, add 12" gravel, 4" pavement: $500,000/mile
- Reconstruction-100% contracted (rebuild): $1,000,000/mile (depending on aggregate source and excavation depth)

NOTE 1: For paved roads wider than 20', the program calculates the additional gravels and pavement.
NOTE 2: Costs based on the following unit prices:

- Asphalt placed: $80/TON
- Milling: $1.00/SY to $2.50/SY (price depends on the depth)
- Reclaim only (no pavement): $1.00/SY to $2.00/SY
- Chip Seal (traditional): $2.50/SY (20,000 SY minimum)
- Chip Seal (10% rubber): $3.50/SY (20,000 SY minimum)
- Chip Seal (20% rubber): $4.50/SY (20,000 SY minimum)

6 Basics of a Good Road: From Vermont Local Roads Fact Sheet (1984 – updated 2009):

- Get water away from the road
- Build on a firm foundation
  "A highway wears from the top, but it falls apart from the bottom."
  "The road base determines the service life of a road."
  "If adequate support does not exist, the road will rapidly deteriorate."
  "A good road requires a suitable foundation which in turn requires stable material."
- Use the best soils possible
  "In deciding what is affordable, towns should consider the long-term consequences of using lower quality material."

"Using inferior base materials may require excessive maintenance during the roads life and perhaps costly rehabilitation before paving."
"The adage <pay me now or pay me later> applies to road building."

- Compact soils well
- Design for winter maintenance
- Design for traffic loads and volumes
- Pave only those roads that are ready
  "Some towns make the mistake of paving a road that is not properly prepared."
- Build from the bottom up
  "A road that has a poor base and poor drainage cannot be adequately improved with a top dressing of gravel and new pavement."
  "It may be necessary in some cases to dig out the old road, put in new material and build up the road in layers."
- Protect your investment
- Keep good records

A Vermont Local Roads article printed in December 2011 titled "Pay now or later: Tips for saving dollars for the long haul" points out the following:

- **"Spending money before rapid depreciation is money well spent"**
- **"Providing good foundations is good road management"**
- **"Cheaper is not always better"**
- **"It may mean the Town does not accomplish all it wants to"**

7 Annual Pavement Maintenance Budget

The Town of Windham's average Annual Pavement Maintenance Budget should be a minimum of $103,000 to preserve the roads in their present state. This represents an average of $11,000/mile of paved roads in the 2017 budget.

- 9.36 miles x $11,000/mile = $103,000/year

This level of paving will only hold the condition of the roads in their present state. In order to improve on the condition it is recommended that the Town of Windham increase funding to the level identified in either Option 1 or Option 2 described below. The driving force behind this is the condition of Windham Hill Road (section 5) and Windham Hill Road (section 6).

Annual Paving Budget: In order to improve on the conditions of the Paved Roads I have identified 2 paving capital plan options for the next 15 years. Option 1 is the most affordable plan pushes out a potential bond to 2031. The 2 options are described in further detail in the Capital Plan.

8 Capital Plan (see attached):

In order to address the reconstruction of Windham Hill Road (section 5) between Abbott Road and Burpee Pond Road and the rehabilitation of Windham Hill Road (section 6) between Burpee Pond Road to the Town line it is likely that a Road Construction Bond will need to be considered. The amount of the bond will be determined when the bond is considered.

The Town of Windham may elect to defer the Capital Work to 2031 as outlined in the affordable Option 1 or to choose the more aggressive Option 2. Should Option 2 be chosen, it is recommended to begin with Windham Hill Road (section 6) and rehabilitee this section of road prior to reconstructing Windham Hill Road (section 5) in 2031. The reason for this is that the completion of section 6 will not be impacted by future construction trucks.

The attached Annual Pavement Management Budget and the Capital Improvement Budget is designed to first preserve the Town Roads, including Capital Projects planned for more than 10 years out. The Town of Windham's Annual Paving and Capital Budget has been developed to address the paved roads in 2 options:

1. Starting at $90,000/year in 2017, increasing by $10,000/year through 2031. A $2,200,000 road bond is proposed in 2030.
2. Starting at $90,000/year in 2017, increasing to $300,000 by 2024, then hold at $300,000 through 2031. This option includes a $2,000,000 road bond with equal payments estimated at $250,000/year beginning in 2019.

The difference between Option 1 and 2 is the affordability and the pace of aggressiveness of both options. Both options address all of the Towns paved roads over the next 5 years.

Paved Road Recommendations

- Beginning in FY2018, provide a minimum funding of $90,000 for Pavement Management. From this point on there are 2 options considered in this plan.
    1. Option 1 increases at a rate of $10,000/year to $230,000 in FY2031.
    2. Option 2 is a more aggressive option and would increase funding rapidly to $300,000 by 2024 and then hold at $300,000 until 2031.
- The gravel base should be verified prior to any Capital Improvement Project to ensure there is adequate support. Windham Hill Road (section 6) is a good example of where test pits may determine whether a reclaim will be sufficient or full depth reconstruction is required.
- All road improvements should be recorded in the Annual Town Report by the Selectboard. The Annual Town Report not only serves as a report to the tax payers but is the best source creating a log of road preservation and Capital Improvements that will be beneficial for future Road Evaluations and Capital Planning.
- The Capital Budget should carry over excess funds to the following years Capital Budget.
- All road material should meet the State of Vermont Specifications for Construction.
- The Capital Plan should be included in the Town Plan.

Road Surface Management System (RSMS)

The evaluation of the Town of Windham's roads was completed in the fall of 2016 utilizing RSMS 11 and modified during mud season 2017. This 2016 survey was completed by Everett Hammond (Hammond Engineering) with the assistance of Josh Dryden (Windham Highway Foreman). RSMS or Road Surface Management System is a management system for roads provided by the Maine Local Roads Center. RSMS 11 provides a condition survey of all gravel roads based on the collection of a wide range of data listed below. This data is utilized to provide a capital plan used in the improvement of the Town's gravel roads. If applied correctly, this plan can be used to apply timely, cost effective road improvements for gravel roads. This RSMS evaluation is a snapshot in time of the condition of Windham's roads to be used as a tool for future planning. Variations of this plan over time may be needed to reflect unexpected changes.

According to the University of New Hampshire technology transfer Center the goal of a Road Surface Management Plan should be the following:

- **Maximize Return on Investment (ROI) for each dollar spent on road maintenance**
- **Maintain highest possible town-wide road quality**
- **Create a transparent, systematic and non-biased methodology for road repairs**
- **Generate long term budgetary estimates and work plans**

Developing the Road Surface Management System involved the following steps:

1. **Data Collection:**
   The following data was collected and utilized in the RSMS Program:

16-17 Rock/Clay
16-18 Rutting
16-19 Loose Aggregate
16-20 Corrugations
16-21 Potholes
16-22 Dust
16-23 Cross Section
16-24 Roadside Drainage

2. **Inventory Results – Gravel Roads:**
   A list of the results from the RSMS Program is attached. The Town of Windham has 20.83 miles of gravel roads with 15.83 miles (76%) of the roads requiring normal maintenance and 3.99 miles (19%) in need of an added 4" of quality gravel, 0.42 miles (2%) in need of rehabilitation and 0.59 (3%) in need of reconstruction.

3. **Repair Strategies – Gravel Roads:**
   There are fewer repair strategies available for gravel roads. The following is a list of these and their respective costs in 2016 dollars based on an average road width of 22'. The following repair strategies have been used in the attached Capital Plan.

- **Routine Maintenance:** This is the most cost effective use of funds and includes ditching, cleaning culverts, grading and the periodic addition of gravel due to natural erosion, washouts and dust.
- **Add 4" of new gravel:** Cost = $50,000/mile ($10/foot)
- **Scrape 6" of new gravel; add 12" of high quality gravel:** Cost = $200,000/mile ($40/foot)
- **Reconstruction (Exc. 18", fabric, Install 22" gravel, 6" underdrain):**
  Cost = $500,000/mile ($100/foot)
  This includes the complete excavation of the existing gravels, installation of fabric and underdrain where necessary and the installation and compaction of 24" new state approved gravels.
  NOTE: All gravel shall meet VT State Specifications.

4. **Basics of a Good Road: From Vermont Local Roads Fact Sheet (1984 – updated 2009):**
   These basic guidelines meant for paved roads also apply to gravel roads with one modification highlighted below.
   - Get water away from the road
   - Build on a firm foundation
     "A highway wears from the top, but it falls apart from the bottom."
     "The road base determines the service life of a road."
     "If adequate support does not exist, the road will rapidly deteriorate."
     "A good road requires a suitable foundation which in turn requires stable material."
   - Use the best soils possible
     "In deciding what is affordable, towns should consider the long-term consequences of using lower quality material."
     "Using inferior base materials may require excessive maintenance during the roads life and perhaps costly rehabilitation before paving."
     "The adage <pay me now or pay me later> applies to road building."
   - Compact soils well
   - Design for winter maintenance
   - Design for traffic loads and volumes
   - **Do not pave a gravel road unless it has been designed to take the traffic. "Some local towns have made the mistake of paving a gravel road only to tear it up within a few short years."**
   - Build from the bottom up
     "A road that has a poor base and poor drainage cannot be adequately improved with a top dressing of gravel."
     "It may be necessary in some cases to dig out the old road, put in new material and build up the road in layers."
   - Protect your investment
   - Keep good records

5. **Annual Gravel quantities/treatment**
   The 20.83 miles of gravel roads in the Town of Windham, VT can lose as much as 1" of gravel on an untreated road. This loss is attributable to erosion and dust. Treating the roads with calcium chloride or magnesium chloride will help to hold the gravel surface in place

during light to moderate rainfall. The following table is a guideline for estimated annual gravel quantities within the Town of Windham.

Town of Windham Gravel Roads: 20.83 miles (average width of 20')		
Gravel Loss	**Cubic Yards per Year (estimated)**	**Cost at $15/CY**
1" per year (untreated)	6,600 Cubic Yards/year	$100,000
½" per year (treated)	3,300 Cubic Yards/year	$50,000

In order to keep the gravel loss to a minimum it is recommended to apply the minimum amount of chloride to the level of application that works for each section of road. Some sections of road that are well shaded may need a minimum amount of chloride or possible no chloride. Chloride should not be applied within 24 to 36 hours of a scheduled heavy rain event. The Town of Windham's average Annual Gravel Budget should be a minimum of $50,000 to keep roads in their present state. This amount of gravel to be used on gravel roads should not be confused with Capital work on those gravel roads in need.

6. Capital Plan (see attached):

The attached Capital Improvement Budget for Gravel Roads is designed to address the concerns of the gravel roads observed over the course of the 2017 mud season. The Capital Plan has been extended to the year 2032. With 24% of Windham's gravel roads needing some degree of Capital Improvement, it will take approximately 20 years to complete at the recommended funding beginning at a level of $5,000/year increase by $5,000/year until at least 2032. The Town of Windham may elect to slow the pace of Capital Work down or pick up the pace by adjusting the average annual Capital Improvements. The proposed level of funding will allow for $525,000 of the $762,100 to be completed over the next 15 years.

Gravel Road Recommendations

- Beginning in FY2019, provide a minimum funding of 50,000 for Gravel Road annual funding.
- Beginning in FY2019, provide a minimum funding of $5,000 for Gravel Road Capital Improvements, increasing by $5,000/year until a desired level of funding level of Capital funding has been obtained. The attached Capital Plan reached the level of $70,000 in the year 2032; however this level may vary depending on the quality of road desires of the Town.
- The existing gravel base should be verified prior to any Capital Improvement Project to ensure there is adequate support.
- All road improvements should be recorded in the Annual Town Report. The Annual Town Report is an excellent location in logging past work history for use in future Road Evaluations and Capital Planning.
- The Capital Budget should carry over excess funds to the following years Capital Budget.

Capital Balance carryover from previous year			0	-5,000	85,000	-35,500	139,500	89,500	-42,800	-42,800	-17,800	-40,661	-15,661	184,339	-142,295	-117,295	-92,295	-92,295
Capital Balance (to carry over)			(5,000)	85,000	(35,500)	139,500	89,500	(42,800)	(42,800)	(17,800)	(40,661)	(15,661)	184,339	(142,295)	(117,295)	(92,295)	(127,295)	182,705

Projected Project Increase Factors:	1	1	1	1	1.05	1.10	1.16	1.22	1.28	1.34	1.41	1.48	1.55	1.63	1.71	1.80

NOTES:

1) Test pits should be completed on all Capital Projects to verify quality & depth of existing base.
2) Projected Project Costs have been increased by 5%/year beginning in 2020. The cost increase factors are listed at the bottom of the table shown above.
3) Table above reflects the Calendar Year (CY) of Construction Funds Available (Budget Year = CY +1)
